DISCUSSION PAPER

Capital Regional District Core Area Wastewater Management Program

Integrated Resource Management Strategy

Discussion Paper – Biosolids/Organic Residuals Strategy Evaluation 031-DP-9

Prepared by:	Dean Shiskowski/Dave Forgie/Dan Pitzler
lssued:	February 4, 2009
Previous Issue:	December 9, 2008

1 **Objective**

Building on previous work completed under this Activity 031, the overall objective of this Discussion Paper is to provide more detailed information on a diverse range of biosolids management / organic residuals energy and resource recovery strategies. This information will enable further development of options for the overall Distributed Wastewater Management Strategy for the Core Area under Activity 036, which includes not only liquid-stream wastewater treatment but also biosolids management and potentially some level of solid waste management integration with wastewater management.

In meeting this objective, this Discussion Paper presents the results of an evaluation conducted on the short-list of broad biosolids management / organic residuals energy and resource recovery alternatives or strategies identified previously in Discussion Paper 031-DP-3. As will become clear to the reader, the analysis is complex and interpretation of the findings involves many nuances. This Discussion Paper is not intended to be an exhaustive written treatise of the analysis and results, but instead highlights key points and serves as background information for discussion.

2 Thematic Strategies

Discussion Paper 031-DP-3 identified and described briefly four short-listed thematic alternatives or strategies that were selected for evaluation. **Table 2-1** summaries the four strategies (#1, #2, #4 and #5, with #3 eliminated per 031-DP-3) with additional information and refinements provided in the following discussion. Table 2-1 also includes three additional sub-strategies that evolved during the analysis of the four strategies.

As shown in Table 2-1, the four broad short-listed strategies include:

- Maximum Beneficial Reuse
- Maximum Integration and Maximum Energy Recovery
- Separate Digestion and Balanced Energy Recovery/Beneficial Reuse
- No Digestion and Balanced Energy Recovery/Beneficial Reuse

d GLOBAL PERSPECTIVE.

Table 2-1.	Short-List of	Thematic	Strategies
------------	---------------	----------	------------

Thematic Strategies	Stabilization	Thermal Destruction	Material End Use	Energy End Use	
1a/b/c/d. Maximum Beneficial Reuse					
SW organics	compost - Hartland Area	n/a	SW organics land application - distributed within/outside CRD	n/a	
WW sludges ¹	digest - Macaulay Area	n/a (1a, 1c); 100% of biosolids to dryer at Hartland Area and Lower Mainland cement kiln (1b); 50% of biosolids to dryer at Hartland Area and Lower Mainland cement kiln (1d)	100% of biosolids to "conventional "land application outside CRD (1a, 1b); 50% of biosolids to "industrialized" land application outside CRD (1d);	pipeline natural gas/vehicle fuel (1b, 1c,	
2. Maximum Integration and Maximum Energy Recovery					
SW organics	co-digest - Hartland Area	co-mass burn with MSW - Hartland Area	bottom ash - reuse; fly ash - separate monofill disposal	pipeline natural gas/vehicle fuel; electricity	
WW sludges	co-digest - Hartland Area	co-mass burn with MSW - Hartland Area	bottom ash - reuse; fly ash - separate monofill disposal	pipeline natural gas/vehicle fuel; electricity	
4. Separate Digestion and Balanced Energy Recovery / Benefical Reuse					
SW organics	digest - Hartland Area	n/a	same as Strategy 1	same as Strategy 2	
WW sludges ¹	digest - Macaulay Area	FBC - Hartland Area	FBC fly ash - separate monofill disposal	same as Strategy 2	
5a/b. No Digestion and Balanced Energy Recovery / Beneficial Reuse					
SW organics	compost - Hartland Area	n/a	same as Strategy 1	n/a	
WW sludges	n/a	FBC - Macaulay Area (5a) or dryer at Macaulay Area and Lower Mainland cement kiln (5b)	FBC fly ash - separate monofill disposal (5a)	electricity (5a)	

Notes:

1. Includes potential for co-digestion of locally generated SW organics.

The implicit assumption in all described strategies is that wastewater sludges generated at all wastewater treatment facilities would be processed at a single location. Given the potential size of a larger distributed treatment facility in the West Shore or other area, it is possible that these facilities could process their own sludges along with some locally generated solid waste organics. However, it is important to note that the assumption described does not have a direct impact on the strategies considered in this paper and the information required in this context. Further consideration of solids processing at distributed wastewater treatment facilities will be assessed in the separate Distributed Wastewater Management Strategy Activity.

Strategy 1a – Maximum Beneficial Reuse (Biosolids to Land Application, Co-Gen)

For this strategy the source-separated solid waste organics would be composted in the area of the Hartland landfill. The wastewater sludges would be anaerobically (thermophilic temperature) digested at a Macaulay area wastewater treatment facility. The resulting biogas would be used to fuel boilers to heat sludge entering the digesters, with excess gas directed to a co-generation system to produce heat and electrical power for on-site use.

There would be no thermal destruction of either solid waste organics or wastewater sludges/biosolids. The residuals from the solid waste organics composting process would be distributed for residential, urban space, and agriculture land application within the CRD up to the limits of demand and then outside the CRD for the remainder.

A recent biosolids market survey (SYLVIS (2008)) found that there is sufficient land area available in the CRD and Cowichan Valley Regional District to recycle biosolids for over a century at the production rates envisioned. While there are only limited opportunities for mine reclamation and landfill use, both agriculture and forestry applications have significant long-term potential. For the purposes of the evaluation, it was assumed that biosolids would be used for forest tree farm fertilization only.

Strategy 1a provides the CRD with the option for some co-digestion of solid waste organics, generated locally, with wastewater sludges. Accepting solid waste organics that require minimal processing (e.g. fats/oils/grease) reduces costs associated with pre-processing.

Strategy 1b – Maximum Beneficial Reuse (Biosolids to Cement Kiln; Biomethane)

Strategy 1b is the same as Strategy 1a, with two exceptions. First, digested biosolids would be hauled to and dryed at a facility located in the Hartland area. The dried biosolids would then be transported via a truck to a cement kiln in the Lower Mainland for use as a coal substitute fuel. Although the energy required for drying would be provided by purchased natural gas, the dried biosolids would be a saleable, revenue generating product that is equivalent to a low-grade coal. The biogenic nature of dried sludges makes it attractive to the cement industries since it reduces the carbon footprint of their operations.

Second, biogas from the co-digestion system, in excess of digester heating requirements, would be upgraded to pipeline quality (e.g. biomethane) and injected into a utility natural gas pipeline as a saleable product.

Strategy 1c – Maximum Beneficial Reuse (Biosolids to Land Application; Biomethane)

Strategy 1c is the same as Strategy 1a, except that excess digester gas would be upgraded to biomethane, and injected into a utility natural gas pipeline, rather than being combusted in a cogeneration system to produce electricity and heat.

Strategy 1d – Maximum Beneficial Reuse (50% Biosolids to "Industrialized" Land Application / 50% to Cement Kiln; Biomethane)

Strategy 1 d combines the final uses of biosolids from Options 1b and 1c, with the intent of providing the CRD additional flexibility in biosolids management. In this strategy, 50% of the digested biosolids would be dryed and transported to a cement kiln for use as a coal substitute fuel. The other 50% of digested biosolids would be hauled to a land application site where willow trees are grown and harvested, with the tree biomass subsequently reused.

As described in Discussion Paper 031-DP-3, the purposeful (i.e. "industrialized") growing and harvesting of trees in this manner is termed "coppice". In Strategy 1d, the harvested trees are assumed to be chipped and sold in the form of woodchips as a saleable, revenue generating product. The analysis assumes that the woodchips would be used in CRD solid waste and other composting operations, as well as other typical uses of woodchip products in the near-term. However, the potential exists to sell the woodchips as a green fuel as such markets develop over time. Harnessing the sun's energy to drive biomass growth through photosynthesis, where biosolids provide some of the carbon and nutrients required for growth, leverages the energy potential contained in the biosolids in this latter context. The net ratio of energy input to energy output for such coppice is approximately 1:40 at the point of harvest (Volk et al 2004).

The strategy assumes that the CRD would lease the land required for willow coppice from private landowners. The land leases would be for a fixed time, allowing the CRD to rotate through land plots as dictated by planting / harvesting cycles. Due to the limited time required annually for planting and harvesting, the strategy assumes that the CRD would contract these activities to the private sector.

Strategy 2 – Maximum Integration and Maximum Energy Recovery

In this strategy the wastewater sludges would be co-digested with the solid waste organics in a thermophilic, anaerobic digestion system located in the Hartland landfill area. Biogas from the co-digestion system, in excess of digester heating requirements, would be upgraded to pipeline quality (e.g. biomethane) and injected into a utility natural gas pipeline as a saleable product.

GLOBAL PERSPECTIVE. LOCAL FOCUS.

The resulting biosolids from this co-digestion would be dewatered and thermally destroyed with municipal solids waste (MSW) at a MSW energy-from-waste (EFW) facility located in the Hartland area. Based on the mass generation projections, the biosolids mass is such that its relative fraction of the combined MSW + biosolids mass is less than the 20% limit imposed by MSW EFW operations. Therefore, no excess biosolids would need to be diverted to another thermal destruction system (e.g. fluidized bed combustion (FBC) system dedicated to biosolids). The MSW EFW facility would produce some electricity and heat for sale (not included in this analysis). The resulting bottom ash would be hauled to the Hartland landfill for use as cover material, with the fly ash transported to a separate mono-fill at the Hartland landfill for disposal.

Strategy 4 – Separate Digestion and Balanced Energy Recovery / Beneficial Reuse

In this strategy the digestion of the solid waste organics and wastewater sludges would be kept separate. The solid waste organics would be digested at a Hartland landfill area digestion facility, with the end product land applied as per Strategy 1. The wastewater sludges would be digested at the Macaulay area treatment facility, dewatered and then hauled to a FBC system located in the Hartland area; there would be no co-mass burning with MSW. The FBC fly ash would be disposed as per Strategy 2.

As in Strategy 2, the excess biogas from the two digestion systems would be upgraded to pipeline quality (biomethane) and injected into a utility natural gas pipeline. Relative to Strategy 2, the difference is that there would be two biogas cleaning/upgrading systems, one at the Macaulay area facility and one at the Hartland area facility.

Strategy 4 provides the CRD with the option for some co-digestion of solid waste organics, generated locally, with wastewater sludges.

Strategy 5a – No Digestion and Balanced Energy Recovery / Beneficial Reuse (Sludge to FBC System)

In this strategy the solid waste organics would be composted at Hartland, as in Strategy 1, with the resulting product used in the CRD area up to the limits of available use and then outside the CRD for the remainder. For Strategy 5a, it is assumed that the undigested, raw wastewater solids would be dewatered and then thermally oxidized in a FBC system at the Macaulay area wastewater treatment plant facility, with the fly ash going to disposal. Some electricity would be produced but the excess above the needs of the FBC system would be used on-site at the treatment facility.

Strategy 5b – No Digestion and Balanced Energy Recovery / Beneficial Reuse (Sludge to Cement Kiln)

Strategy 5b is the same as Strategy 5a, except that the undigested, raw wastewater solids would be dewatered and dried at the Macaulay area treatment facility and transported via a truck to a cement kiln in the Lower Mainland for use as a coal substitute fuel.

3 Methodology

3.1 Overview

The biosolids / organics strategy evaluation was conducted within the Sustainability Assessment Framework (SAF) described previously in Discussion Papers 031-DP-1 and 031-DP-3. Two key information inputs into the SAF are the findings of the economic life cycle analysis (LCA) and the carbon footprint analysis (CFA). Section 3.2 describes the LCA, with Section 3.3 outlining the CFA. Section 3.4 then describes the SAF methodology.

3.2 Life Cycle Analysis

Each of the strategies was subjected to a financial life cycle analysis. The LCA included the capital expenditures, operations (e.g. labour, energy, chemicals, administration, etc.) and maintenance costs, revenue generated from saleable products, and costs of greenhouse gas (GHG) emissions incurred during an analysis horizon that extended from Year 2016 (i.e. the date the first facilities would be in service) to Year 2065, which was the end of the planning horizon. The costs of all future expenditures were brought back to a present (i.e. Year 2008) value, with the total net present value (TNPV) being the summation of all these present values.

The LCA analysis details and assumptions are documented in the LCA worksheets contained in **Appendix A**; however, it is worth describing several key points in more detail.

Land Costs

Land costs were not included in the capital costs, under the assumption that the CRD owns or would have to buy land in the Macaulay and Hartland areas to meet other requirements of the wastewater management program. It was assumed that the land purchases would be conservative, meaning that sufficient land would be bought to provide the CRD future flexibility to site facilities. As a result, these assumptions treat all strategies equal and thus remove the land costs as an analysis variable.

The annual cost to lease land for the willow coppice program in Strategy 1d was included as an operations costs in the analysis.

LCA Base Scenario and Sensitivity Analysis

The LCA was initially conducted with what was defined as the Discount Rate Base scenario. In this scenario, the investment rate of return was set at 7% per year with all inflation rates (e.g. labour, energy, GHG costs, etc.) set at 3% per year. Therefore, the overall discount rate was 4% per year.

A subsequent sensitivity analysis was then conducted to assess the impact of investment rates of return and inflation rates on the TNPV of each strategy. The examined scenarios included:

Discount Rate Low - The investment rate of return was set at 4% per year with all inflation rates (e.g. labour, energy, GHG costs, etc.) set at 2% per year. Therefore, the overall discount rate was 2% per year.

Discount Rate High - The investment rate of return was set at 10% per year with all inflation rates (e.g. labour, energy, GHG costs, etc.) set at 4% per year. Therefore, the overall discount rate was 6% per year.

Energy High – The investment rate of return was set at 7% per year and all inflation rates were set at 3% per year, with the exception of energy (electricity, natural gas/biomethane, diesel fuel, cement kiln coal substitute) set at 4% per year.

Two additional scenarios were also considered in the sensitivity analysis, which focused on the future price of GHG emissions (i.e. for the purposes of purchasing off-sets on an open market or paying a carbon tax) expressed as carbon dioxide equivalents (CO2e). Based on the Intergovernmental Panel on Climate Change (IPCC) information provided in Discussion Paper 032-DP-1, the price of CO2e in Year 2065 CO2e was assumed to vary between US\$15 and US\$155 t / CO2e. Using this information, the following scenarios were analyzed:

CO2e Low – The investment rate of return was set at 7% per year and all inflation rates were set at 3% per year, with the exception of CO2e set at 0.0% per year (i.e. CO2e remains constant at the \$15 / t per the current 2009 value from the Province of British Columbia Carbon Tax (2008)).

CO2e High – The investment rate of return was set at 7% per year and all inflation rates were set at 3% per year, with the exception of CO2e set at 4.2% per year to give a 2065 CO2e price of about \$155 / t.

Price of Saleable Products

The biosolids / organics strategies evaluated produce saleable products that could be used outside the wastewater infrastructure and sites proper and thus are a potential revenue source for the CRD. As discussed in Section 2, these products include pipeline grade natural gas (biomethane), a lowgrade coal substitute, and woodchips. The various strategies also produce biosolids for use in the forest tree farm fertilization and compost derived from solid waste organics, the latter of which would be suitable for residential and urban space land application within and outside the CRD. However, the evaluation assumes that neither the biosolids nor compost would be revenue generating, saleable products. Rather, these products would be offered to the public at no charge in the initial years to gain public acceptance of the products. The analysis conservatively assumes a free product throughout the analysis horizon.

For the purpose of the evaluation the biomethane was priced at the same rate as utility-supplied natural gas. For dried wastewater sludges/biosolids sold to cement kilns as a low-grade coal substitute, the evaluation assumes that the price of the dried sludges/biosolids was the same as the

market rate for low-grade coal on an energy-equivalent basis. Woodchips from the willow coppice program were priced at the current market rate for woodchips.

GHG Credits

The LCA assumes that the CRD would claim the GHG credits (i.e. would be credited the price of the CO2e mass) for the biomethane and coal substitute products sold. The LCA also assumes that the CRD would receive the GHG credits for solid waste organics compost it used as a commercial fertilizer replacement.

3.3 Carbon Footprint Analysis

The carbon footprint analysis for each strategy was conducted in accordance with the general methodology and rationale described in Discussion Paper 032-DP-1, to which the reader is directed for additional information. Like the LCA, the CFA extended from Year 2016 to Year 2065. The total GHG emissions for a given strategy are the summation of predicted emissions for the entire analysis duration.

Scope 1 direct GHG emissions included such sources as vehicles (e.g. transporting material) and treatment process units (e.g. methane leakage from digester systems). Scope 2 indirect GHG emissions included those associated with consumption of purchased electricity or natural gas. GHG emission off-sets, such as the avoided use of commercial fertilizer, are an example of a Scope 3 item.

The CFA analysis details and assumptions are documented in the LCA/CFA worksheets contained in **Appendix A**.

3.4 Sustainability Assessment Framework

As presented previously in Discussion Papers 031-DP-1 and 031-DP-3, the two evaluation elements of the sustainability assessment framework (SAF) include the multi-objective alternative analysis (MOAA) and the risk identification and analysis (RIA). The reader is directed to the prior Discussion Papers for further information on the SAF and associated MOAA and RIA. However, for ease of reference, Appendix B contains the relevant MOAA Objectives Hierarchy, Performance Measures and Scales, the Objectives Hierarchy Weights that were developed in consultation with CRD staff, and the RIA Risk Assessment Matrix and the Risk Impacts used in the biosolids / organics strategy evaluation documented in this Discussion Paper. Some modifications were made to the performance scales used in the evaluation, related to life cycle costs, GHG emissions, non-GHG emissions, and chemical demand based on the information generated in the current evaluation.

As noted above, CRD staff provided key input for the relative weightings of the various objectives used in the MOAA analysis. These weightings formed the MOAA Base scenario. A sensitivity analysis was conducted on the relative weights used in the objectives hierarchy. The sensitivity

analysis considered eight scenarios relative to the Base scenario, where the relative weightings were adjusted independently as follows:

- Minimize net present value (relative importance weight = 50 versus 100 in Base scenario)
- Environmental (relative importance weight = 70 versus 100 in Base scenario)
- Socioeconomic (relative importance weight = 80 and 60 versus 70 in Base scenario)
- Flexibility (relative importance weight = 100 and 20 versus 60 in Base scenario)
- Ease/Safety of Operations and Maintenance (relative importance weight = 90 and 20 versus 50 in Base scenario)

4 Results and Discussion

4.1 Life Cycle Analysis

General Findings

Figure 4-1 summarizes the total net present value (TNPV), which includes both costs and revenues, for each strategy under the Discount Rate Base scenario. Figure 4-1 also shows a category labeled "electrical value". This category refers to electricity generated by facilities that is not saleable off-site, but is used on-site to reduce external electrical demand, and is thus not considered as part of revenue. The category was included for illustrative purposes to show the value of the produced power.

From a TNPV perspective, the strategies form two main groups based on the level of analysis and associated uncertainty. Strategies 1b, 1d, 2 and 4 form the group with the higher TNPV, with Strategies 1a, 1c, 5a and 5b forming the lower TNPV group. Although Strategies 1a and 5a do not generate saleable products, their low capital cost NPV, relative to the other strategies, contribute to their low TNPV. The same conclusion applies to Strategy 5b, which benefits from the sale of a coal substitute. Strategy 1c has the lowest overall capital cost NPV.

Strategies 1a and 1c provide an interesting comparison. Combusting biogas in a co-generation system produces electricity with a NPV (\$8.3M, Strategy 1a) almost identical to the value of the biogas upgraded to biomethane in Strategy 1c (NPV = \$8.0M). However, Strategy 1c benefits more financially via the GHG offset NPV because biomethane more significantly offsets GHG emissions from avoided natural gas combustion relative to avoided GHG emissions associated with off-site electrical power production. The low GHG intensity of BC Hydro-supplied electrical power contributes to this latter finding.

One other related point is noteworthy in the biogas/co-generation versus biogas/biomethane comparison. The analysis assumes that biomethane has the same value as natural gas, i.e. \$10/GJ. However, given the energy content of diesel fuel (0.039 GJ/L), and using the assumed \$1.50/L value of diesel fuel, it can be shown that diesel fuel has a potential value of \$42/GJ. Therefore, biomethane as a diesel fuel replacement, rather than a natural gas replacement, has a greater potential value. The "potential" part is key, since significant infrastructure would be required

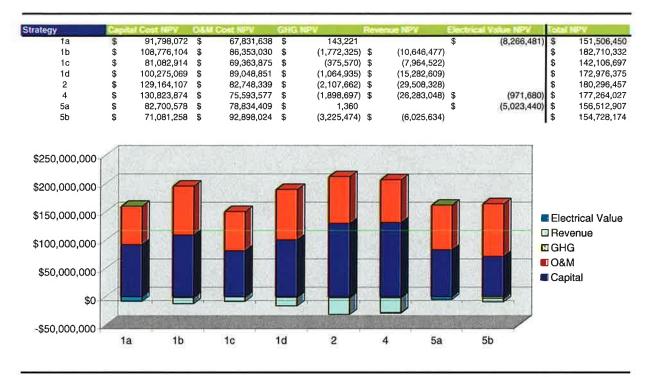

Figure 4-1. Total Net Present Value Summary (discount rate base scenario)

to compress, store and distribute biomethane for use as a diesel fuel replacement. The actual market value of biomethane in this context is also uncertain. However, these values show the potential for biomethane as a vehicle fuel.

It is important to note that Strategy 2 includes a MSW incinerator, of which part of its capacity is used to process digested wastewater sludges and solid waste organics. These proportional costs are included in the LCA and the TNPV. However, a real capital cost of approximately \$200M, as well as future O&M costs, would be incurred by the CRD solid waste program to pay for the capacity needed to process the residual solid waste material. These costs are not included in the LCA or TNPV.

Biomethane production in Strategies 2 and 4 generate significant revenues that are bolstered by digestion of solid waste organics in addition to wastewater sludges. However, these sales do not entirely off-set the significant overall capital investment required in these strategies, which do include thermal reduction elements. Strategies 1b, 1c and 1d also produce biomethane, but to a much lower extent since the solid waste organics are composted rather than digested in this alternative.

Strategy 5b generates notable revenues in the sale of dried wastewater sludges as a coal substitute for cement kiln use. Although Strategy 5b has one of the lowest capital cost NPV of all alternatives, the need for natural gas for sludge drying adds a considerable operation cost that is not incurred in the other strategies except for Strategy 1b. Strategy 1b also produces a coal substitute product, but its revenues are even lower since the wastewater solids are digested prior to drying (i.e. reduces calorific value of dried solids and thus their commercial value). Finally, Strategy 1d also provides a coal substitute product following solids digestion, but these revenues are one-half of those of Strategy 1b since only one-half of the Strategy 1d solids are converted into the coal substitute product.

Strategy 1d gains revenue from the sale of the woodchips from the willow coppice program, which is unique to this particular strategy, and has a NPV of approximately \$6.0M. For the given analysis assumptions for this strategy, the woodchips have a significantly higher potential revenue value than the equal amount of dried biosolids (NPV of \$6.0M versus \$1.3M)

As shown in Figure 4-1, Strategies 1a and 5a would induce a cost to the CRD for greenhouse gases (GHG) emitted, where the other strategies would receive a "credit". As described above and noted in Appendix A, the LCA assumed that the CRD would receive a financial GHG credit for its saleable products (i.e. biomethane, dried wastewater sludges) and its own use of solid waste organics compost as a commercial fertilizer replacement. However, regardless of strategy, the cost/credit is relatively small and comprises less than 2% of the TNPV.

GLOBAL PERSPECTIVE.

Sensitivity Analysis

Figure 4-2 contains the results of the sensitivity analysis described in Section 3.2. Figure 4-2a shows the Discount Rate Base data, which are the same TNPVs provided in Figure 4-1. Figures 4-2b through 4-2f contain the data for the other scenarios assessed.

In general, from a TNPV perspective, the strategy groupings from the Discount Rate Base scenario are preserved in the Discount Rate High (Figure 4-2c), CO2e Low (Figure 4-2e) and CO2e High (Figure 4-2f) scenarios. The low relative cost of the GHG emissions does not practically impact the TNPV under either of the CO2e scenarios.

The Discount Rate Low (Figure 4-2b) and Energy High (Figure 4-2d) scenarios do induce a noticeable change in the relative TNPVs and the strategy groupings. Strategies 5a and 5b are particularly sensitive to the low discount rate, since these strategies have high O&M costs, much of which are incurred in the future, relative to capital costs that are primarily incurred in the near-term. The same situation, but to a lesser extent, applies to Strategy 1b. The Energy High scenario induces a similar but more subtle effect, where Strategies 1b, 1d and 5b use of natural gas make them particularly sensitive to energy price increases.

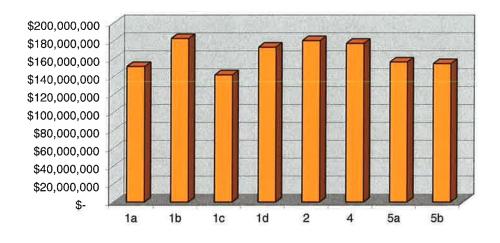

4.2 Carbon Footprint Analysis

Figure 4-3 shows the total estimated amount of GHGs (i.e. CO2e) emitted over the time frame of the analysis. The numerically negative values represent an environmentally positive situation – GHGs are being off-set rather than being generated. Consider Strategy 5b, where dried wastewater sludges are being used as a replacement for coal that would normally be used to fuel a cement kiln, which stands out for having the lowest carbon footprint. The sludges, which are a biogenic fuel whose emissions are assumed to not contribute to the carbon footprint, off-set the combustion of coal and the use of natural gas to dry the sludges. In a similar, but less significant manner, the biomethane produced in Strategies 2 and 4 off-set the use of natural gas by the public and benefit from the biomethane associated with solid waste organics. These strategies also have significant environmental benefits from a GHG perspective. Although Strategies 1b and 1d produce less biomethane (i.e. no solid waste organics digested) or coal substitute compared to the other strategies, their production of both of these off-setting products contributes to a positive environmental result. Finally, Strategy 1c does benefit from the production of biomethane, again offsetting natural gas use.

Strategies 1a and 5a are close to being GHG neutral. Their GHG emissions are partially off-set by using composted solid waste organics as a replacement for synthetically produced commercial fertilizer. Commercial fertilizers are energy intensive to produce and distribute, with the hydrogen in the formed ammonia originating from fossil fuels. Strategies 1b, 1c, 1d, 4 and 5b also benefit from this use of composted solid waste organics. In addition, Strategy 1a benefits from producing electricity, using digester biogas, which off-sets GHGs associated with purchased electricity. Strategy 5a provides a similar off-set using electricity produced by the FBC system.

a) Discount Rate Base - Investment rate of return = 7% per year and all inflation rates set at 3% per year. Thus discount rate = 4% per year.

Strategy	Total N	NPV
1a	\$	151,506,450

Strategies with digester systems (1a, 1b, 1c, 1d, 2 and 4) are disadvantaged because of the assumed loss (i.e. leakage) of digester gas and thus methane from the system.

4.3 Sustainability Assessment Framework Analysis

MOAA Scores and RIA Ratings

Table 4-1 presents the Multi-Objective Alternative Analysis (MOAA) scores, and the rationale for the scores, for each strategy. As noted in Table B-1 (Appendix B), where there where no specific units (e.g. \$, t CO2e, etc.) assigned to a particular objective, the scoring for the various strategies was based on a relative rating of 1 (lowest score) to 5 (highest score) per the performance scales described in Table B-1. These scores were assigned by the consultant team based on their professional judgment. Alternatively, for some objectives, the actual calculated values (e.g. \$, t CO2e, etc.) obtained from the LCA and CFA were used directly as the scores for the strategies.

Table 4-2 presents the Risk Identification and Assessment (RIA) ratings and outcomes for the various strategies. The ratings were based on the risk outcomes identified in Table B-4 (Appendix B) and were again assigned by the consultant team based on their professional judgment. Further discussion on these ratings and outcomes is provided later in the Discussion Paper.

SAF Results

Based on the objectives hierarchy weightings developed by CRD staff shown in Table B-2 (Appendix B), the individual MOAA scores for each strategy were normalized and added to provide the Total Score for each strategy. **Table 4-3** provides the MOAA total score summary. In Table 4-3 a higher numeric value, either for the individual normalized scores or the total score, is a more positive result. The reader will note the presence of several zero values in Table 4-3 – such a result is an artifact of the normalization procedure. Take for example the 0.0 score for Strategy 1b for Objective 1. The 0.0 value simply means that Strategy 1b had the highest TNPV value of all strategies and thus was assigned no points that contribute to the total score. Also note that not all Objectives have a zero value – this results from there being several sub-objectives within some of the main Objectives, which creates a situation where there was at least one score that was not zero and thus the score sum for the Objective is greater than zero.

Figure 4-4 graphically presents the same information as that of Table 4-3, along with the RIA summary from Table 4-2. **Figure 4-5** illustrates the sub-objective scores within the main Environmental, Socioeconomic and Flexibility objectives.

From a MOAA total score perspective, Strategies 1c and 5b clearly stand out from the other strategies with their higher and essentially equal values. While Strategy 1c has a lower TNPV that provides it additional points in the MOAA analysis, it concedes notable points to Strategy 5b, which scores higher from an environmental perspective: fewer vehicle non-CO2e emissions (i.e. based on diesel fuel consumption) and a much more substantial GHG off-set (Figures 4-3 and 4-5a).

c) Scores for Maintaining Flexibility

Figure 4-5. MOAA Sub-Category Scores for a) Environmental, b) Socioeconomic and c) Flexibility Categories

The higher TNPVs for Strategies 1b, 1d, 2 and 4 penalize these strategies in the MOAA analysis. Although these same strategies have significant environmental benefits, primarily related to the GHG off-set they provide as well as reduced vehicle emissions, they cannot overcome the disadvantage induced by their high TNPVs.

The remaining objectives, which include socioeconomic (Figure 4-5b), flexibility (Figure 4-5c) and ease/safety of operations and maintenance (Figure 4-4), have only a minor influence on the MOAA total scores given the small relative difference between strategies.

Table 4-5 presents the results of a sensitivity analysis that assessed the impact of changed objective weightings on the MOAA total score values. The upper portion of the table shows the actual scores as they varied with a change in weightings. The lower portion of the table shows the resulting rank order of each of the strategies. The sensitivity analysis findings are notable in that the strategy rankings were practically insensitive to objective weighting. Regardless of scenario, Strategies 5b and 1c ranked the highest, Strategy 1b always ranked the lowest, and there was some minor shuffling of ranking of the other strategies depending on scenario. This finding suggests that the "base" scenario findings are robust.

Discussion and Moving Forward

As evident from the preceding discussion, the SAF analysis is complex, receiving input from the LCA, CFA and RIA evaluations and incorporating new information external to these evaluations. The challenge is one of sifting through this information and identifying a "winning" strategy or combination of specific elements that comprise such a strategy. The strategy / elements will then be adopted for developing the Options for the overall Distributed Wastewater Management Strategy for the Core Area under Activity 036. It is important to note that the same biosolids / solid waste organics strategy will be used for all distributed management options developed in Activity 036. Use of the selected strategy or elements in this context does not imply a final decision, but rather forms a reasonable basis for the development and evaluation of the overall wastewater management Options.

One way to consider this information is at a strategy level. Figure 4-4 is a good place to start as it summarizes not only the MOAA scores but also shows the risk signatures. As discussed previously, Strategies 1c and 5b stand out from the others on the basis of their MOAA total scores. Both of these strategies have a similar risk signature. Strategy 1c was assigned a higher public acceptability risk rating because of its use of land application of biosolids – prior CRD experience suggests that this is a real risk factor. Alternately, Strategy 5b was assigned a higher technologic and financial risk because of its drying of raw wastewater sludges and sending them to a cement kiln for use as a coal substitute fuel – there is uncertainty with long-term contracts with cement kilns and, if the CRD should need to change their course of action, the substantial capital investment in sludge drying equipment could be forfeited.

At the other extreme are Strategies 1b and 2. They had the lowest MOAA total scores, largely owing to their having the highest TNPVs of any of the strategies. In Strategy 1b, the combination of

first digesting wastewater solids and then drying them prior to transport to a cement kiln induces significant capital costs. Strategy 2 is impacted by the large capital cost of providing digestion capacity for solid waste organics, relative to the cost of composting infrastructure, in addition to the high costs associated with directing the wastewater sludges and solid waste organics to a MSW ETW facility for thermal destruction. However, although Strategy 1b and 2 have very similar TNPVs and MOAA total scores, their risk signatures are markedly different. Strategy 1 b has the second lowest risk signature of any strategy, largely owing to its flexibility. For example, if the cement kilns refused to accept the dried sludges at some point in time, the biosolids, because of digestion, are a stable product that could be land applied at least for an interim period. Alternately, Strategy 2 was deemed to have a relatively high risk signature. Siting a MSW ETW facility in the Hartland area, along with a substantive co-digestion facility, could encounter significant public opposition. Strategy 2 is also more vulnerable to technologic and financial risks because of this same infrastructure – any changes in direction would have significant cost impacts. Strategy 2 does have some risk benefits due to the lack of land application of either biosolids or solid waste compost and the elimination of potential climate change impacts (e.g. increased precipitation during the wet season) on such practices.

As shown in Figure 4-4, Strategy 1d has the lowest overall risk signature. This result owes to multiple biosolids end uses and the types of end uses themselves. Strategy 1d does involve land application of some biosolids, but the more "industrial" willow coppice program that uses these biosolids would be under the direct control of the CRD as would the land leased by the CRD. This situation would reduce the potential for odour or environmental problems, which can arise due to third party contractual issues or poorly planned programs. As a result, it is reasonable to expect a lower risk of public acceptability concerns. The multiple biosolids end uses of Strategy 1d also reduce the technologic and financial risk by allowing the CRD to not "put all eggs into one basket". Although there are risks associated with sludge drying and cement kiln contracts, as noted above, the use of sludge digestion helps to mitigate this risk as discussed previously.

Another way to examine the SAF information is in the context of specific, fundamental questions rather than focusing singly on the individual strategies, as discussed below.

Does it make sense to <u>fully</u> integrate the wastewater and solid waste programs? The Strategy 2 information suggests likely not. The need to dewater all raw wastewater sludges at a Macaulay area WWTF and transport them to the Hartland landfill area for co-digestion with solid waste organics comes at an economic and environmental cost. However, this finding does not preclude some element of integration between the programs. For example, as identified as an option for Strategies 1 a/b/c/d and 4, solid waste organics generated in areas close to the WWTF could be transported to the WWTF for co-digestion with wastewater sludges. The solid waste organics would be pre-processed (e.g. screened and slurried) at a solid waste transfer station and transported in closed tanker trucks to minimize odour potential. The risks of such an approach are minimized – the CRD would gain experience with this concept before larger-scale implementation and associated commitment.

The approach described above provides the CRD flexibility to consider its solid waste program independent from the wastewater program, at least in the near-term, and study the solid waste question in more detail. For example, there is the question of separate digestion of solid waste organics versus composting. The information generated by the SAF analysis indicates that the former approach exacts a significant capital cost premium. At the same time, the environmental benefits of digestion are significant when the biogas is upgraded to biomethane and then used to off-set natural gas use. In addition, the revenue potential of this biomethane is also significant and needs to be considered in light of the overall operations and maintenance costs, GHG carbon credits/cost and capital costs.

The described program de-coupling also allows the CRD to more fully examine the question of solid waste residuals management and how a MSW EFW facility could fit into its long-term plans. In addition, the decision to not fully integrate the wastewater and solid waste programs in the short-term would not preclude the CRD from using a future MSW EFW facility as a biosolids destination / disposal method in the longer term.

On this basis, for the purposes of developing the options for the overall Distributed Wastewater Management Strategy for the Core Area under Activity 036, it is assumed that wastewater / solid waste integration will focus on local opportunities for co-digestion of wastewater sludges and solid waste organics rather than the full integration of the two programs.

Should wastewater sludges be stabilized via digestion and what should the resulting biosolids end use be? This is a very complex question because ultimately it is associated with the material end use. Wastewater sludges or biosolids have three broad possible destinations: (i) some form of land application, (ii) third party cement kiln, and (iii) CRD thermal destruction facility (e.g. wastewater FBC system or MSW EFW facility).

First consider the information generated for Strategies 1c (i) and 5b (ii). Both strategies have similar TNPVs (i.e. \$152M vs. \$155M) and both generate similar revenues for their saleable products (biomethane NPV = \$8M vs. coal substitute fuel = \$6M). Alternately, Strategy 5b offers significant GHG off-sets relative to Strategy 1c (735,000 vs. 110,000 t CO2e), which contributes to the approximate saving in the GHG NPV of about \$3M. Both Strategies have similar risk signatures. As discussed previously, Strategy 1c considers the public acceptability risk associated with land application of biosolids in a typical forestry situation, where Strategy 5b carries the technologic and financial risk of dealing with a third party (i.e. cement kiln(s)) and the uncertainty of long-term contracts. In either case, the CRD would incur significant costs should it need to change directions abruptly, although it could be argued that Strategy 1c may be more accommodating in turns of the time needed to implement a changed direction. Strategy 1c also likely carries less technological risk – wastewater sludge digestion is a well-understood process with a very long and successful implementation history. Alternately, drying of raw wastewater sludges has a more limited and recent history, yet there are successful examples of CRD-scale operations in North America.

Now consider Strategy 1b, which is a blend of Strategies 1c and 5b. It has the second lowest risk signature of any strategy, but it does come at a financial premium that manifests itself in having the highest TNPV of all strategies. Strategy 1b has the advantage of directing biosolids to land application, should the cement kiln option be terminated, without incurring significant additional costs. If the forestry land application route was not available, because of public opposition, the dryed sludges could be hauled to a MSW EFW facility. The dryed state of the sludges makes them particularly well suited for feed for such a facility.

Finally, Strategy 1d provides the lowest risk signature of all strategies, as explained previously, but it attains this position with a further blending of approaches without as severe of a financial premium relative to Strategy 1b. As a result, Strategy 1d better balances the cost of a strategy with its risk.

On the basis of the perspectives discussed, digestion of wastewater sludges offers the CRD a robust, flexible approach that does have risk management benefits. This approach may also implicitly include some level of biosolids land application, which can be further mitigated through using a willow coppice program rather than a conventional forestry application program.

Should biogas produced by digestion be used for electrical co-generation or should it be upgraded to biomethane? Review of information generated for Options 1a and 1c by the LCA, CFA and ultimately SAF provide a direct answer to this question. Although the value of electricity produced by co-generation is roughly equal to the saleable value of biomethane, as discussed in Section 4.1, co-generation is more costly, provides less credit in terms of GHG costs and does not offer the environmental (i.e. GHG) benefits provided by biomethane production. These findings are reflected in the lower TNPV, reduced carbon footprint and higher MOAA total score, which are all positive attributes, for Strategy 1c relative to Strategy 1a.

Although biomethane production is something new to North America, there is an established, albeit still limited, history of implementation in Europe (e.g. Sweden). Current industry trends suggest that North American wastewater utilities and municipalities are giving biomethane production serious consideration, which in turn is associated with vendors further developing the technology required and pursuing opportunities available. The relatively low costs of biomethane upgrading, in comparison to electrical co-generation, further mitigate the risk of pursing this direction.

Therefore, these findings suggest that a reasonable approach in developing options for the overall Distributed Wastewater Management Strategy in Activity 036 should include biomethane production rather electrical co-generation.

GLOBAL PERSPECTIVE.

5 Summary

This Discussion Paper presents the key findings of an evaluation conducted on a short-list of broad biosolids management / organic residuals energy and resource recovery strategies identified previously in Discussion Paper 031-DP-3. The evaluation findings provide direction for developing and evaluating options for the overall Distributed Wastewater Management Strategy in Activity 036 that include, specifically:

- The integration of the wastewater and solid waste programs will focus on local opportunities for co-digestion of wastewater sludges and solid waste organics rather than the full integration of the two programs.
- Wastewater sludges will be assumed to be digested with one-half of the resulting biosolids land applied in an "industrial" willow coppice program and the other one-half of biosolids being dryed and transported to Lower Mainland cement kilns for use as a coal-substitute fuel.
- Biogas produced by digestion will be assumed to be upgraded to biomethane and sold to the natural gas utility rather than being used for co-generation of electricity.

It is important to note that the selected biosolids / organic residuals strategy or elements in this context does not imply a final decision, but rather forms a reasonable basis for the development and evaluation of the overall wastewater management Options conducted in Activity 036.

calorific value of dried sludge =	22,000 KJ/kg	
calorific value of dried biosolids =	18,000 KJ/kg	
calorific value of cement kiln coal =	26,000 KJ/kg	
Maintenance:		
unit allowance (unless otherwise stated) =	1.0% of capital works	
Administration:		
lump sum annual allowance =	<mark>\$ 100,000</mark> /yr	
NPV Analysis:		
first year in analysis =	2008	
investment rate of return =	7.0% /yr	Notes Velue for Discourt Data Data data di
capital works and purchased land inflation rate =	3.0% /yr	Note: Values for Discount Rate Base scenario.
labour inflation rate =	3.0% /yr	
electricity inflation rate =		
natural gas/biomethane inflation rate =	3.0% /yr	
diesel fuel inflation rate =	3.0% /yr	
cement kiln coal substitute =	3.0% /yr	
	3.0% /yr	
woodchips inflation rate (willow coppice) =	3.0% /yr	
land lease inflation rate (willow coppice) =	3.0% /yr	
chemicals inflation rate =	3.0% /yr	
trucking / equipment rate =	3.0% /yr	
ash disposal inflation rate =	3.0% /yr	
maintenance inflation rate =	<mark>3.0%</mark> /yr	
administration inflation rate =	3.0% /yr	
GHG CO2e price inflation rate =	3.0% /yr	Note / Ref: Year 2065 CO2e cost assumed to vary between US\$15 and US\$155 t / CO2e, as per 032-DP-1
	\$ 81 /tonne CO2e	and based on Tirpak (2008).
GHG Sources:		Ref: BC Hydro's (2005) prediction for 2010 was 72 t/ GWh, which is a large increase from the 33 value predicted for 2005 and
BC Hydro-supplied electricity =	72 g CO2e/kWh	projections were found.
diesel fuel combustion (mobile truck) =	2,757 g CO2e/L	Ref: Table A13-5, EC (2006). Moderately controlled HDDV.
natural gas combustion (stationary) =	0.0562 g CO2e/KJ	Ref: Table 2.5, IPCC (2006). Tier 1 Value is for residential category and commercial/institutional category.
biogas escape from digester systems =	1% of produced and used biogas	Ref: de Haas et al (2008)
biogas methane content =	65%	
methane density =	662 g methane / m3 methane	Ref: p. 8-9, USEPA (2008).
methane global warming potential =	23 × CO2	Ref: IPCC (2006)
GHG Off-sets:		
solids content of finished SW compost =	60%	
fraction of applied compost off-setting commercial fertilizer use =	25%	Note: Applicable to all users of compost product, including CRD.
fraction of off-set commercial fertilizer use attributed to CRD use =	20%	Note: Applicable to CRD for purposes of financial analysis.
unit avoided commercial fertilizer use emission factor =	0.10 t CO2e/dry t applied compost	Ref: Value based on information from Abu-Orf et al (2008) and Yamagata et al (2008) for biosolids, assumed comparable for
		nen valde based on monnation nom Abu-on et al (2000) and ramagata et al (2008) for biosolids, assumed comparable for
cement kiln coal combustion =	2,072 g CO2e/kg	Ref: EC (2006).
biomethane combustion (stationary) =	0.0562 g CO2e/KJ	Note: as above for natural gas.
	3 9 9 2 9 1 9	note, as above for fractular gas.

Subject: Key Calculation Assumptions For Life Cycle and Carbon Footprint Analyses

Yellow-shaded cell denotes assumed/input value

and actual values of 46 and 22 for 2000 and 2003, respectively. No other future

or compost.

Notes:
 Includes transport of biosolids to land application site plus actual land application.
 Includes transport of compost product to distribution site for public pickup.
 Assumes that land applied biosolids are not off-setting commercial fertilizer use.
 Negative values imply an off-set and are considered as an offset in the analysis.

 Notes:

 1. Includes transport of compost product to distribution site for pickup by public.

 2. Includes transport of biosolids to land application site and land application costs.

 3. Includes disset fuel, driver, maintenance costs.

 4. Excludes CO2e off-sets of commerical fertilizers by non-CRD end users (i.e. assumes that the CRD would not be able to sell these "credits").

 5. Includes only SW organics electrical cost.

 6. Not a saleable product; overall revenue neutral.

File: Prepared: Last Revision:

20062935.04.E.03.01 D. Shiskowski, D. Forgie November 28, 2008 Last Revision By: D. Shiskowski

Notes:

Includes transport of biosolids to land application site plus actual land application.
 Includes transport of compost product to distribution site for public pickup.
 Assumes that land applied biosolids are not off-setting commercial fertilizer use.
 Negative values imply an off-set and are considered as an offset in the analysis.

Subject: Strategy 1b Maximum Beneficial Reuse (Biosolids to Cement Kiln; Biomelhane) Material Flows and GHG Emissions

\$105

Notes:
1. Includes transport of compost product to distribution site for pickup by public.
3. Includes diesel fuel, driver, maintenance costs.
4. Excludes CO2e off-sets of commerical fertilizers by non-CRD and users (i.e. assumes that the CRD would not be able to self these "credits"). Includes CO2 off-sets from sale of biomethane and dried WW sludges.

Notes: 1. Includes transport of biosolids to land application site plus actual land application.

Includes transport of composit product to distribution site for public pickup.
 Assumes that land applied biosolids are not off-setting commercial fertilizer use.

P:\20062935\04_Concept_Plan\Engineering\03.00_Conceptual_Feasibility_Design\01_IRM_Strategy\031-DP-9_Analysis\dnt_Organics_LCA_ds_xls, Alt 1c - Material Flows and GHG

Subject: Strategy 1c Maximum Beneficial Reuse (Biosolids to Land Application; Biomethane) Material Flows and GHG Emissions

Notes:
1. Includes Iransport of compost product to distribution site for pickup by public.
3. Includes diesel fuel, driver, maintenance costs.
4. Excludes CO2e off-sets of commerical fertilizers by non-CRD end users (i.e. assumes that the CRD would not be able to sell these "credits"). Includes CO2 off-sets from sale of biomethane.

Notes:

 Includes transport of biosolids to land application sile plus actual land application and coppice equipment.
 Includes transport of compost product to distribution site for public pickup.
 Assumes that land applied biosolids are not off-setting commercial fertilizer use.
 Negative values imply an off-set and are considered as an offset in the analysis.

Subject: Strategy 1d Maximum Beneficial Reuse (50% Biosolids to Cement Kiln; 50% to "Industrial" Land Applicaiton; Biomethane) Material Flows and GHG Emissions

Notes:
1. Includes transport of compost product to distribution site for pickup by public...
3. Includes transport of compost product to distribution site for pickup by public...
4. Encludes CO2e off-sets of commencial fertilizers by non-CPD and users (i.e. assumes that the CRD would not be able to set linese "credits"). Includes CO2 off-sets from sale of biomethane and chied WW studges.
5. Includes WW coppes planting and harvesting equipment.

Notes: Includes diese [[ue], driver, maintenance costs, Sasumes disposal in a purpose built andfill. Includes chemicate for PEC system operation. Sasumes CRD would be able to 'sell' credits from biomethane. Excludes CO2e off-sets of commerical fartilizers by non-CRD end users (i.e. assumes that the CRD would not be able to sell these "credits"). Sasumes CRD would be able to 'sell' credits from biomethane. Excludes CO2e off-sets of commerical fartilizers by non-CRD end users (i.e. assumes that the CRD would not be able to sell these "credits"). Saturd Sasumes CRD would be able to 'sell' credits from biomethane. Excludes CO2e off-sets of commerical fartilizers by non-CRD end users (i.e. assumes that the CRD would not be able to sell these "credits"). Saturd Satu

Notes: 1. Excludes CO2e off-sets of commerical fertilizers by non-CRD end users (i.e., assumes that the CRD would not be able to sell these "credits"). 2. Assumes disposal in a purpose built landfill. 3. Includes diesel fuel, driver, maintenance costs. 5. Includes only SW organics electrical cost. Electricity produced by WW studge FBC considered in note 6. 6. Not a saleable product; overall revenue neutral.

Subject: Strategy 5a (FBC) No Digestion and Balanced Energy / Beneticial Reuse Discount Rate Base Lite-Cycle Analysis

Notes

1. Excludes CO2e oil-sets of commerical lertilizers by non-CRD end users (i.e. assumes that the CRD would not be able to sell these "credits"). Assumes CRD can "sell" credits from dried WW sludges, 2. Includes diesel fuel, driver, maintenance costs.

Subject: Strategy 5b (cernent kiin) No Digestion and Balanced Energy / Beneficial Reuse Discount Bale Base

APPENDIX B - Sustainability Assessment Framework Material

GLOBAL PERSPECTIVE. LOCAL FOCUS.

Table B-1. Objectives Hierarchy, Performance Measures and Scales

Objectives Hierarchy		Performance Scales	
	5	3	
1. Minimize Net Present Value of Life Cycle Cost (includes accounting for revenues)	Lowest NPV from LCA		Highest NPV from LCA
2. Minimize Environmental Impacts			
Non-CO2e emissions (PM10, NOx) from vehicles	Lowest fuel consumption from LCA/CFA		Highest fuel consumption from LCA/CFA
GHG emissions generated from energy, process, end use and transportation	Lowest total GHG emissions from CFA		Highest total GHG emission from CFA
Localized odours from LW/SW infrastructure	No noticeable odours likely	Odour potential with sensitive receptors at more than one site	Odour potential with sensitive receptors at five or more site
Chemical demand	Lowest chemical use from LCA		Highest chemical use from LCA
3. Minimize Socioeconomic Impacts			
Community disruption	WW solids or SW organics being trucked only to and from existing locations		End use products hauled to new reuse locations
Potential siting concerns such as cultural and terrestial resource protection (historic, cultural, archaeologically signifcant resources, endangered species, etc).	Extremely unlikely that cultural and/or terrestrial resources will be affected	Cultural and/or terrestrial resources may be affected, but effects can likely be mitigated	Unmitigatable cultural and/o terrestrial resource effects likely
Economic development opportunities	WTE brings the potential for industial development and beneficial use of steam and electricity		No WTE
I. Maintain Flexibility			
Consistent with implementation schedules for both wastewater and solid waste programs	No foreseeable impact on implementation schedule of either program	Potential delay of up to two years in implementing one program	Highly likely result in 2 or mor year delay in implementation one program
Maintains the abiltity to adapt to beneficial future technologies and opportunities	No thermal destruction at CRD facility		Thermal destruction at CRD facility limits future options
Ability to respond to future regulatory change	No land application of biosolids and no WTE (emission requirements)		Land application of biosolids and WTE
5. Ease and Safety of Operations and Maintenance	No WTE or WW/SW digestors		WTE and WW/SW digestors (pressure, steam)

Others considered but not explicity included:

Maximize resource recovery, biogas recovery or minimize energy - should be captured in CO2e measurement

Technological flexibility is relevant for wastewater treatment but less so for biosolids and organics. Also, see risks.

Economic development not likely to help us distinguish between alternatives

Waste diversion - all alternatives assumed to divert similar quantities of organics from landfill Public process / education - won't distinguish between alternatives

Politically implementable - a means to an end

Table B-2. Objectives Hierarchy Weights

Objectives Hierarchy	Relative Importance Weight	% of Total
1. Minimize Net Present Value of Life Cycle Cost (includes accounting for revenues)	100.0	26.3
2. Minimize Environmental Impacts		
2a. Non-CO2e emissions (PM10, NOx) from vehicles	31.3	8.2
2b. GHG emissions generated from energy, process, or end use	31.3	8.2
2c. Localized odours from LW/SW infrastructure	31.3	8.2
2d. Chemical demand	6.3	1.6
3. Minimize Socioeconomic Impacts		
3a. Community disruption	36.8	9.7
3b. Cultural and terrestrial resource protection (historic, cultural, archaeologically signifcant resources including endangered species)	22.1	5.8
3c. Economic development opportunities	11.1	2.9
4. Maintain Flexibility		
4a. Consistent with implementation schedules for both wastewater and solid waste programs	15.0	3.9
4b. Maintains the abiltity to adapt to beneficial future technologies and opportunities	15.0	3.9
4c. Ability to respond to future regulatory change	30.0	7.9
5. Ease and Safety of Operations and Maintenance	50.0	13.2

Table B-3. Risk Assessment Matrix

Likelihood	Impact								
	Insignificant	Minor	Moderate	Major	Extreme				
Almost Certain	Mi	М	Н	С	C				
Likely	м	м	н	С	с				
Possible		м	м	н	н				
Unlikely	L .	L	м	н	Н				
Rare	le le	L.	м	М	М				

L low risk M medium risk H high risk C critical risk

Table B-4. Risk Impacts

Public Acceptability Risk Impacts

Any new wastewater or solid waste project is likely to result in opposition. The risk of adverse public perception, including political risks, is evaluated in the context of whether an activity is likely to run counter to public expectations. If the opposition is strong enough, experience has shown that the project might fail to be implemented as planned.

Rating	Impacts / consequence
Insignificant	 Project enjoys broad support with no organized opposition. No news coverage Media call but no follow up story
Minor	 Pockets of isolated opposition to the project. Negative letter(s) to the editor
Moderate	 Substantial proportions of the public are against the project. Public opinion survey results in a below average / unsatisfactory rating A negative news story
Major	 Public opinion negative. Project would fail in a public vote. Intervention from city political leadership; city legislation Negative news storiesm
Extreme	 Public opinion strongly aligned against project. Project would soundly fail in a public vote. Daily local negative news stories Negative national news coverage Vote of no confidence by elected representatives

Technologic and Financial Risk Impacts

The risk exists that a new process or technology will not work as planned, thus resulting in unbudgeted costs and political embarrassment to correct the deficiencies. Such unanticipated changes in costs have the potential to trigger unplanned rates increases or decreases.

Rating	Impacts / consequence
Insignificant	 Does not require budget revisions No rate or financial performance impacts Some staff time to correct errors
Minor	Small but noticeable impact on short-term financial performance, with no noticeable impact on medium to long term rate path(s)
Moderate	small short-term rate impact with small rate impact on medium and long-term rate path
Major	moderate short-term rate impact with moderate rate impact on medium and long-term rate path
Extreme	High short-term rate impact with high rate impact on medium and long-term rate path

Climate Change Risk Impacts

The risk exists that climate change will result in unanticipated sea level rise and/or a substantial increase in the volatility of weather patterns and extreme events. Such changes have the potential to require costly retrofits to parts of the wastewater or solid waste system.

Rating	Impacts / consequence
Insignificant	 Does not require budget revisions No rate or financial performance impacts Some staff time to correct errors
Minor	Small but noticeable impact on short-term financial performance, with no noticeable impact on medium to long term rate path(s)
Moderate	small short-term rate impact with small rate impact on medium and long-term rate path
Major	 moderate short-term rate impact with moderate rate impact on medium and long-term rate path
Extreme	High short-term rate impact with high rate impact on medium and long-term rate path
